1.0 Introduction

1.1. Objective

The Test Plan is an aggregation of information, which describes the entire test activity for this project. It covers the entire testing effort (unit, development test, system verification test, and Beta). It identifies the product requirements, schedules, resource requirements (people, effort and equipment), quality, assumptions, exclusions, and risks.

A preliminary Test Plan is prepared for the Project Team during the System Phase of PEAQ Process. This Test Plan will be updated in the earliest possible time of the Implementation Phase, so that progress can be tracked during implementation.

1.2. Project Description

GolfScore is a program used to generate reports of golfers' results for a golf tournament. The input to the program will consist of a file containing two types of records as described in Section 2.4 the software requirements specification (SRS) . The output from the program will consist of up to 3 reports as described in Section 2.5 in SRS. The program is executed via a command line interface – there is no GUI associated with the application. The program will be run as a stand-alone executable, and can be run from a command line prompt, from within an IDE (Integrated Development Environment), etc. Input to the program will come from an input record file, and output from the program will go to output record files in a format suitable for printing. Any errors in the inputs or outputs will be handled as specified in Section 2.6 in SRS.

1.3. Process Tailoring

1. Validation

Phase of testing requirements. We will use: non-functional testing: technical review, specify the requirements.

2. Verification(system testing)

Functional testing program. The product must meet the specification as described in Section 2 (Functional Requirements) in Software Requirements Specification/Design Document.

3. System integration testing

Top-down Integration Testing. The tested product is very consistent because the integration testing is basically performed in an environment that almost similar to that of reality

Stubs can be written with lesser time because when compared to the drivers then Stubs are simpler to author.

4. Module testing

Component testing may be done in isolation from rest of the system depending on the development life cycle model chosen for that particular application. In such case the missing software is replaced by Stubs and Drivers and simulate the interface between the software components in a simple manner.

If some modules are not developed we need to use Test Doubles with stubs.

5. Unit testing

White-box testing

2.0 Assumptions/Dependencies

The number of golf courses specified for the tournament can be from 1 to 5. Each golfer is expected to play each course once.

The number of golfers entered in the tournament can be from 2 to 12.

Each golf course has 18 holes, and par for each hole is either 3, 4 or 5 strokes.

A golfer's score for a each hole is determined as shown in Section 2.3.2 and is based on the number of strokes under or over par taken to complete that hole. Thus score and stroke count are not the same.

A golfer's stroke count for a particular golf course is the sum of the stroke counts for each of the 18 holes

A golfer's score for a particular golf course is the sum of the scores for each of the 18 holes.

A golfer's total tournament score is the sum of his or her scores for all courses played.

Note that the lower a golfer's stroke count (relative to par), the higher his or her score for that hole.

Any field beyond the output-directory field will be ignored and will not be considered an error(2.6.1 in SRS).

If any other errors, which are not specified in the specification, occur while attempting to write the output files, program behavior is unspecified(2.6.3. in SRS).

1. Validation deadline: 27.09.2021
2. Verification(system testing) deadline: 11.10.2021
3. System integration testing deadline: 11.11.2021
4. Module testing deadline: 15.02.2022
5. Unit testing deadline: 15.04.2022

3.0 Test Requirements

1. GolfScore Release 1.1. The program will display its title and revision number on the screen at execution time.(1.2)
2. GolfScore will be written in either C or C++ and is intended to run on a PC running Windows 2000 or any later version.(1.3)
3. Format for calling GolfScore: **>golf options filename output-directory** (see Section SRS 2.2)
4. Scoring (see Section 2.3.2 in SRS)
5. Data Input (see Section 2.4 in SRS)
6. Data Output (see Section 2.5 in SRS)
7. Error Handling (see Section 2.6 in SRS)

4.0 Test Tools

Software Requirements Specification, JUnit, Eclipse, Mockito

5.0 Resource Requirements

Responsible test engineer's: John Hopkins, Jane Black , Alice Kulikova, Ronald Potter
Project Manager and Development Lead Engineers: Tom White, Kevin Puhovsky

6.0 Test Schedule

1. Validation 13.09.2021 - 27.09.2021
2. Verification(system testing) 28.09.2021 - 11.10.2021
3. System integration testing 12.10.2021 - 11.11.2021
4. Module testing 12.11.2021 - 15.02.2022
5. Unit testing 16.02.2022 - 15.04.2022

7.0 Risks/Mitigation

Financial, Reputation, Customer/User Base, Employees

8.0 Metrics

The following metrics data will be collected. Some will be collected prior to, and some after product shipment.

Prior to shipment:

Effort expended during DVT, SVT and Regression

of defects uncovered during DVT, SVT and Regression, and development phase each defect is attributable to

Test tracking S-Curve

PTR S-Curve

After shipment:

of defects uncovered and development phase each defect is attributable to

Size of software

Appendix B – Detailed Test Schedule

Appendix A – Detailed Resource Requirements

Human Resources:

Test Designer – Bob Ray

Responsible test engineer's: John Hopkins, Jane Black , Alice Kulikova, Ronald Potter

Project Manager and Development Lead Engineers: Tom White, Kevin Puhovsky

Appendix C - Test cases

ID	Test action	Expected Result	Actual Result
S-01	Calling GolfScore	Display help information on the screen; filename and output-directory are ignored, if present.	
S-02	Generate Course Report	Course Report is generated, data is written in the golfout file	
S-03	Generate Tournament Ranking Report	Tournament Ranking Report is generated, data is written in the golfout file	
S-04	Generate Golfer Report	Golfer Report is generated, data is written in the golfout file	
S-05	Generate Course Report and Golfer Report	Course Report and Golfer Report are generated, data is written in the golfout file	
S-06	Generate Tournament Ranking Report and Golfer Report	Tournament Ranking Report and Golfer Report are generated, data is written in the golfout file
